

Every day and during times of emergencies, public health departments make our country a healthier and safer place to live and work. Public health aims to prevent health threats before they occur. Although responsible for much more, public health prevents the spread of disease and chronic conditions that impact the health status of a community and drive health care spending. Across the country, public health departments bring people together in emergencies and provide regular assistance to their communities and continue to evolve to meet their needs.

High-performing public health departments use data-driven, evidence-based practice to be good stewards of public money and address community priorities. Delivering protections in their communities at this level requires a strong foundation of **public health infrastructure**.

Built on a strong foundation of **public health infrastructure**, public health departments provide public health protections in a number of areas, including: preventing the spread of communicable disease, ensuring food, air, and water quality are safe, supporting child and maternal health, improving access to clinical care services, and preventing chronic disease and injury. In addition, public health departments provide local protections and services unique to their community's needs.

The infrastructure needed to provide these protections strives to provide fair opportunities for all to be healthy and includes seven capabilities: 1) Assessment/Surveillance, 2) Emergency Preparedness and Response, 3) Policy Development and Support, 4) Communications, 5) Community Partnership Development, 6) Organizational Administrative Competencies and 7) Accountability/Performance

Management. Practically put, health departments have to be ready 24/7 to serve their communities. That requires access to a wide range of critical data sources, robust laboratory capacity, preparedness and policy planning capacity, and expert staff to leverage them in support of public health protections. Like all infrastructure, it tends to degrade over time without proactive maintenance and deliberate efforts to upgrade its capabilities as communities grow and evolve.

Evidence suggests many public health departments don't have the dedicated funding needed to build-out and sustain their public health infrastructure. Without them, public health departments simply can't deliver seamless, high-quality protections the public expects. In fact, one recent landmark study estimated a nationwide gap in funding public health infrastructure at \$4.5 billion.¹

In ways large and small, public health departments prevent the spread of disease and bring people together to help communities stay healthy. To continue these activities and respond to new threats, the governmental public health system needs an ongoing commitment to fund the foundational public health infrastructure from federal, state and local governments.
